

Ecommerce Sales Analysis – Summary

This project analyzes ecommerce sales data from 2011 to 2014 using Microsoft Excel to evaluate business performance across revenue, profit, and product categories.

Key Findings:

- The business shows consistent revenue growth over time, indicating strong market demand.
- Profit increases each year but does not scale proportionally with sales.
- Profit margins remain moderate (~12–13%), highlighting inefficiencies.
- Certain categories (Technology, Office Supplies) drive most revenue.
- Furniture underperforms and contributes less to profitability.
- Sales are highly concentrated in a few subcategories, increasing dependency risk.
- Strong seasonal trends observed, with peak sales in later months.

Overall Insight:

While the business is growing in terms of sales, it is not operating at optimal efficiency. Profitability is being impacted by factors such as discounting, category imbalance, and product dependency.

Conclusion:

The focus should shift from pure revenue growth to improving profit margins, optimizing product mix, and reducing business risk for sustainable long-term performance.
